A semiconductor material has an electrical conductivity value falling between that of a conductor, like copper, gold, etc. and an insulator, such as glass. Their resistance decreases as their temperature increases, which is behaviour opposite to that of a metal. Their conducting properties may be altered in useful ways by the deliberate, controlled introduction of impurities ("doping") into the ...

In article number 1802173, Xiao-Yu Yang and co-workers present a junction of oxygen and titanium vacancies at the amorphous-anatase interface of nanostructured TiO₂ for creating what chaos theory describes as the network fabric, which results in a unique n-p electronic transmission and contributes to significant performance in photogeneration current, photocatalysis, and energy storage.

The metal-oxide-semiconductor field-effect transistor (MOSFET, MOS-FET, or MOS FET) is a type of field-effect transistor (FET), most commonly fabricated by the controlled oxidation of silicon. It has an insulated gate, whose voltage determines the conductivity of the device. This ability to change conductivity with the amount of applied voltage can be used for amplifying or switching electronic ...
