T.J. Moyer, in Lead-Acid Batteries for Future Automobiles, 2017. 19.6.7 Safety relevant requirements. Lead-acid batteries use corrosive sulfuric acid as electrolyte, and both hydrogen and oxygen are evolved during charging. Therefore, special measures are needed to prevent both acid leakage and charging gas ignition.

Figure 1: Typical lead acid battery schematic Lead acid batteries are heavy and less durable than nickel (Ni) and lithium (Li) based systems when deep cycled or discharged (using most of their capacity). Lead acid batteries have a moderate life span and the charge retention is best among rechargeable batteries.

If using lead and acid to store an electrical charge sounds archaic, it is. The first lead-acid battery was invented in the 1850s, and the battery in your car uses the same basic principles. The designs and materials have evolved over the years, but the same basic idea is in play.

Lead acid batteries are a chemical system that stores energy. Discharging the battery converts the stored chemical energy into electrical energy that can be used to perform work. Two electrodes, Pb (Lead) and PbO<sub>2</sub> (Lead Oxide) are submerged in a solution of H<sub>2</sub>SO<sub>4</sub> (Sulfuric Acid). PbSO<sub>4</sub> (Lead Sulfate) forms on both electrodes when discharging.
